WHY WE PLANT TREES?

San Francisco's urban forest brings numerous benefits to the city's streets. Street trees contribute to a comfortable pedestrian environment by slowing traffic, providing a sense of scale and softening the urban landscape. They benefit environmental quality, economic vitality, and public health. Street trees enhance our environment by providing habitat for urban wildlife, reducing stormwater runoff, and improving air quality. It has been demonstrated that street trees enhance property values in residential neighborhoods and commercial areas. Trees add beauty and visual interest to our streets and remind us of natural cycles and changing seasons.

Some examples of how Urban trees improve the quality of our lives:

- Real estate values: A UC Davis report estimates that San Francisco street trees increase property values by 6.7 million dollars per year
- Air quality: According to US Forest Service research, the average tree in a residential neighborhood removes 330 pounds of carbon dioxide from the air as well as produces enough oxygen for a family of four.
- Psychological Well-Being: Urban residents have been found to experience less anger, sadness and insecurity when viewing well-treed surroundings
- Traffic calming: Drivers perceive the street as narrower and drive more cautiously.
- Economic vitality: Studies have shown that people are more likely to shop on streets that are planted with trees.
- Trees help kids learn: Studies have shown that student's attention spans are increased when they have a view that includes trees.
